Chest X-ray Taking Procedures Training for X-ray technicians/ Radiographer

“Anatomy of the Chest”

Ms. KHIN YADANAR MOE
Consultant (TB CXR Training), IDDS Project/ Myanmar
Content

- Bony Thorax
- Topographic Positioning Landmarks
- Lungs
- Parts of the Lungs
Anatomy of The Chest

Thorough knowledge of the anatomy of the chest helps radiographer in producing quality CXR images.
Bony Thorax

• Provides a protective framework for the parts of the chest involved with breathing and blood circulation

**Anteriorly**
- Superior portion is the manubrium
- Large center portion is the body
- Smaller inferior portion is the xiphoid process

**Superiorly**
- Two clavicles (collarbones) that connect the sternum to the 2 scapulae (shoulder blades)
- The 12 pairs of ribs

**Posteriorly**
- 12 thoracic vertebrae

### Topographic Positioning Landmarks

<table>
<thead>
<tr>
<th><strong>Vertebra prominence (7th cervical vertebra)</strong></th>
<th><strong>An important landmark for determining the central ray (CR) location on (PA) chest projection</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Can be <strong>palpated</strong> readily on most patients by applying light pressure with the fingertips at the base of the neck</td>
</tr>
<tr>
<td></td>
<td><strong>First prominent process</strong> felt as you gently but firmly palpate down the back of the neck with the head</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Jugular notch (manubrial or suprasternal notch)</strong></th>
<th><strong>An important landmark for determining the CR placement on (AP) chest projections</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This is <strong>palpated easily</strong> as a deep notch or depression on the superior portion of the sternum below the thyroid cartilage dropped forward</td>
</tr>
</tbody>
</table>

Lungs

• Located on each side of the thoracic cavity

• **Right lung** is made up of **three lobes** - the superior (upper), middle, and inferior (lower) lobes divided by **two deep fissures**

• **Inferior fissure**, which separates the inferior and middle lobes, is called the oblique fissure
Lungs – Cont.

- **Horizontal fissure** separates the superior and middle lobes.
- **Left lung** has only **two lobes** - the superior (upper) and inferior (lower).
- Separated by a **single deep oblique fissure**.
- Composed of a light, spongy, highly elastic substance called parenchyma, allows for the breathing mechanism responsible for expansion and contraction of the lungs.
Lungs – Cont.

• Each lung is contained in a delicate double-walled sac, or membrane, called the pleura

• Outer layer of this pleural sac lines the inner surface of the chest wall and diaphragm and is called the parietal pleura

• Inner layer that covers the surface of the lungs, also dipping into the fissures between the lobes, is called the pulmonary or visceral pleura
Lungs – Cont.

• **Potential space between the double-walled pleura**, called the **pleural cavity**, contains a lubricating fluid that allows movement of one or the other during breathing.

• When a lung collapses, or when air or fluid collects between these two layers, this space may be visualized radiographically.
Lungs – Cont.

• Air or gas present in this pleural cavity results in a condition called a **pneumothorax**, air or gas pressure in the pleural cavity may cause the lung to collapse.

• Accumulation of fluid in the pleural cavity (pleural effusion) creates a condition called a **haemothorax**.
Lungs – Cont.

## Parts of Lungs

**Radiographically important parts of the lungs**

<table>
<thead>
<tr>
<th><strong>Apex (B)</strong></th>
<th><strong>Carina (C)</strong></th>
<th><strong>Base (C)</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>The rounded upper area above the level of the clavicles</td>
<td>The point of bifurcation, the lowest margin of the separation of the trachea into the right and left bronchi</td>
<td>Each lung is the lower concave area of each lung that rests on the diaphragm (E)</td>
</tr>
</tbody>
</table>

Important part of the lungs must be included on chest radiographs.

Parts of Lungs – Cont.

- **Costophrenic angle** (F) refers to the extreme outermost lower corner of each lung, where the diaphragm meets the ribs.

- Relative locations of the uppermost and lowermost parts of the lungs - the *apices* and the costophrenic angles, respectively should be included on every chest radiograph.

Parts of Lungs – Cont.

- Pathology, such as a small amount of fluid collection, would be evident at these costophrenic angles in the erect position.

- Hilum (G), also known as the root region, is the central area of each lung, where the bronchi, blood vessels, lymph vessels, and nerves enter and leave the lungs.
