

IGRAs in Children

Deborah Anne Lewinsohn, MD

Associate Professor

Infectious Disease, Pediatrics

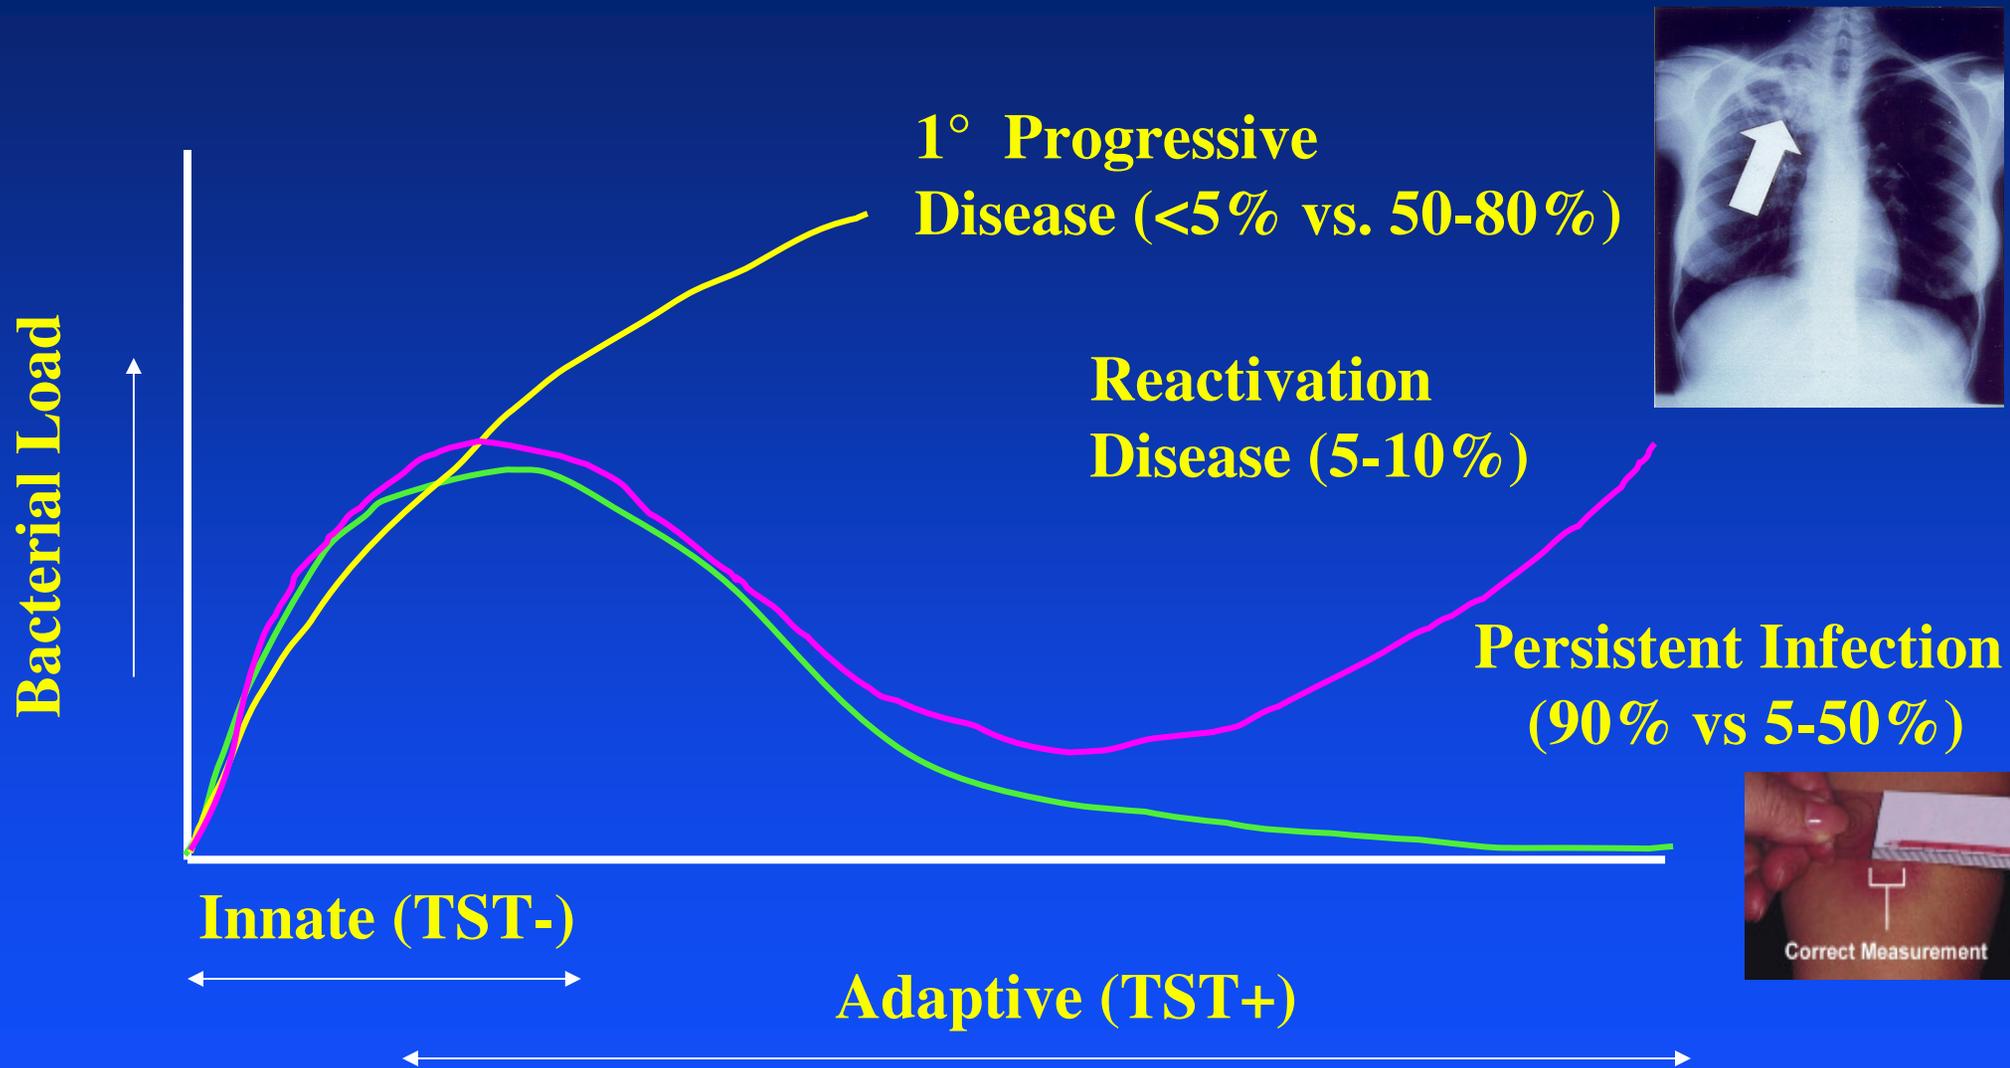

OREGON
HEALTH & SCIENCE
UNIVERSITY

Disclosure Statement: Deborah Lewinsohn

- I have no significant financial interests in Cellestis or Oxford Immunotech.
- All relevant financial interests are as follows:
 - Cellestis: Honoraria for three Cellestis-sponsored meetings for role as a participant, moderator, or invited speaker.
 - Oxford Immunotech: Sponsored research contract to provide T cells to use for QC for T-spot.*TB*.

Natural History of *M. tuberculosis* Infection

Adapted from: Henry Boom, TBRU, CWRU

Diagnosis of LTBI using TST

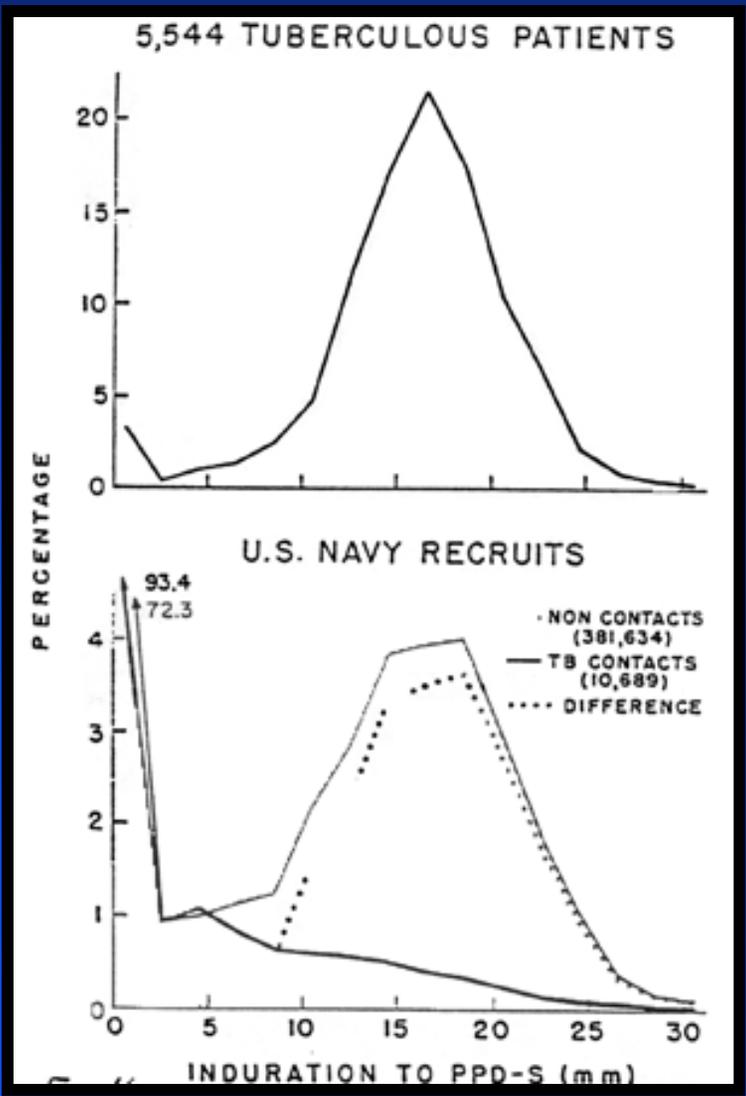

*Photographs: Dr. Chuck Daley,
National Jewish Medical Center*

Problems include:

- Inter-reader variability; requires return visit.
- Confusing cutoffs for various risk groups.
- Low positive predictive value in countries with low prevalence
- False negatives
 - Anergy: HIV/ESRD
 - Recent TB
 - Very young
 - Overwhelming disease
- False positives
 - BCG vaccination
 - Nontuberculous mycobacteria

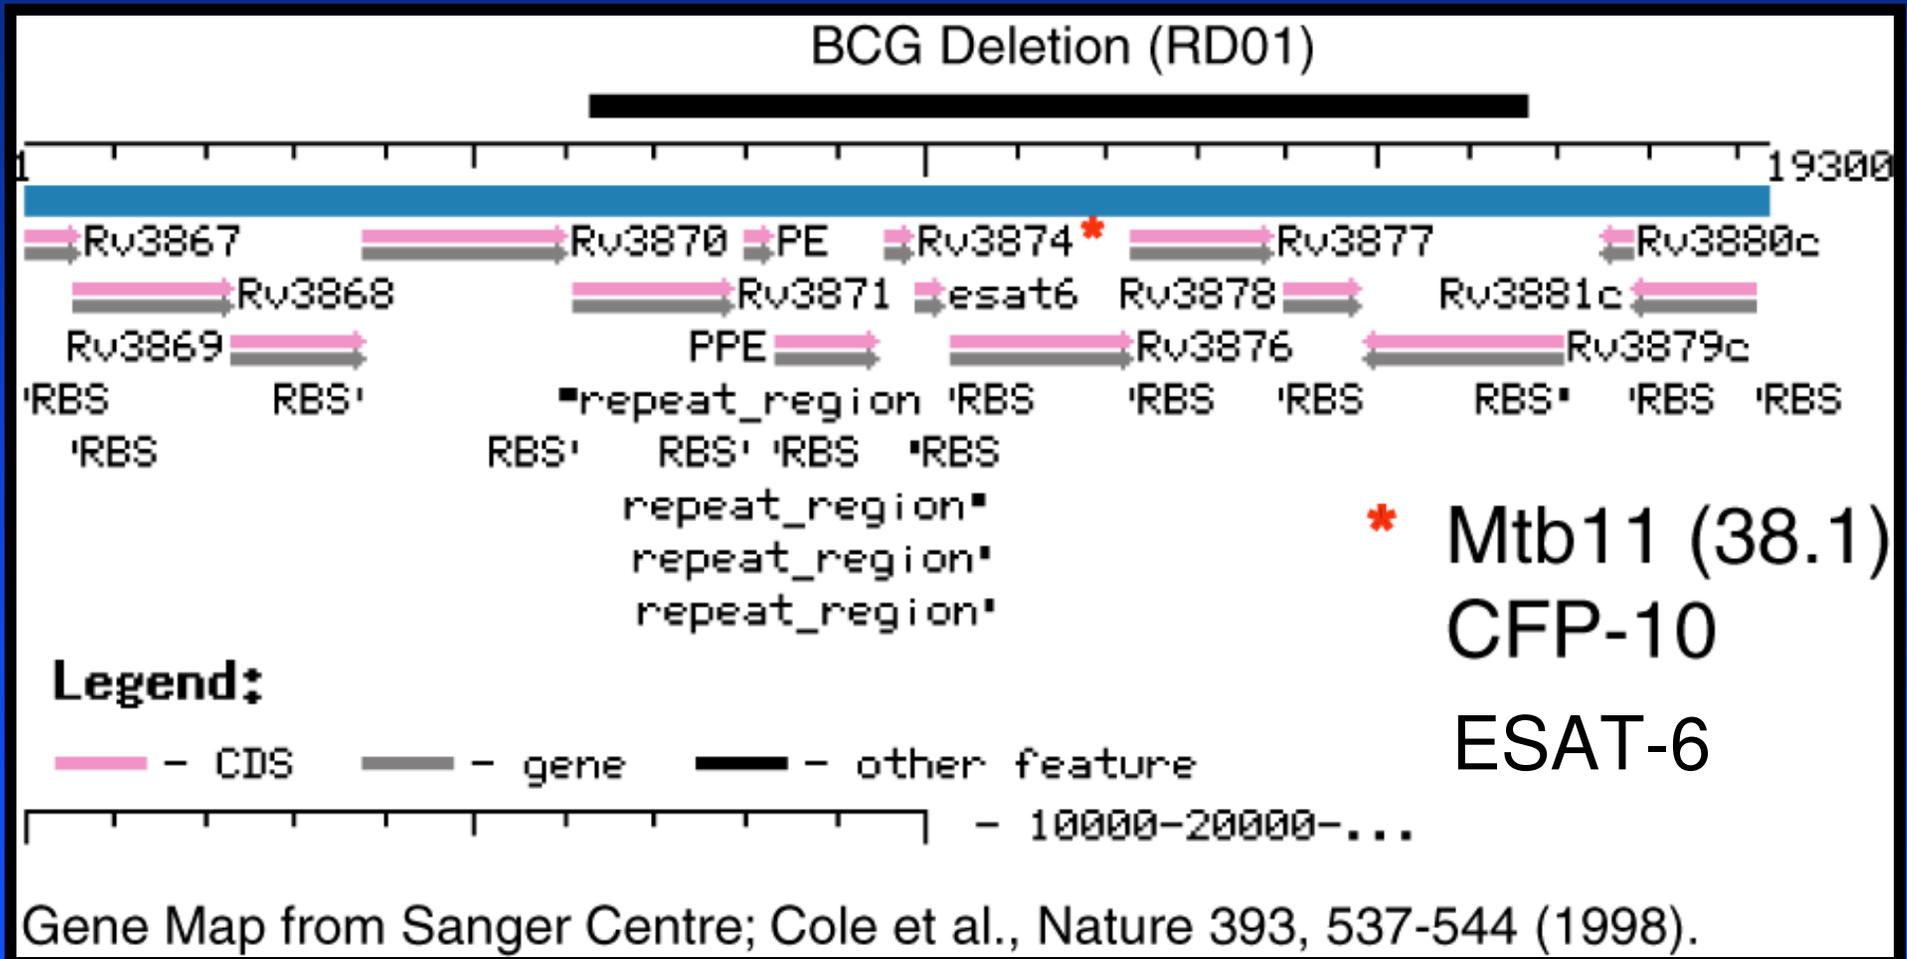

Diagnosis of Mtb infection by TST: TB controllers' comfort food

T cell based diagnostics for TB: IFN- γ Release Assays (IGRA's)

- Potent pro-inflammatory cytokine released by T cells and NK cells. Assays reflect adaptive T cell response to TB.
- Two commercially available tests:
 - T-spot[®].TB; ELISPOT.
 - QuantiFERON[®]-TB Gold IT; ELISA.

Antigens Absent from BCG

TST vs IGRA

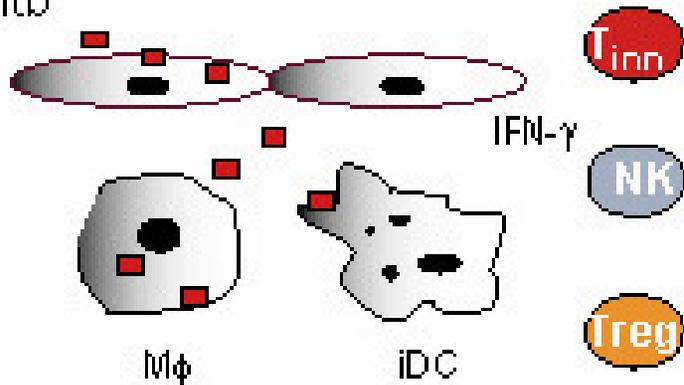

| | TST | IFN |
|--|--|---------------|
| Cell Types | CD4 CD8 Basophils DC and Macrophages | CD4 (CD8) |
| Cytokines | IL-4, IFN- γ TNF- α , IL-10, IL-12, G-CSF, | IFN- γ |
| Associated with Protective Immunity | No | Yes |
| Timing | 2-5 Days | Short Term |
| Homing Phenotype | Skin | Polymorphic |

QuantiFERON®-TB Gold IT: ELISA

Adapted from QuantiFERON®-TB Gold IT product insert

QuantiFERON®-TB Gold IT: ELISA

Interpretation of test result

| Nil [IU/mL] | TB Antigen minus Nil [IU/mL] | Mitogen minus Nil [IU/mL] ¹ | QuantiFERON®-TB [IU/mL] | Report/Interpretation |
|--------------------|-------------------------------|--|----------------------------------|---|
| ≤ 8.0 | < 0.35 | ≥ 0.5 | Negative | <i>M. tuberculosis</i> infection NOT likely |
| | ≥ 0.35 and < 25% of Nil value | ≥ 0.5 | | |
| | ≥ 0.35 and ≥ 25% of Nil value | Any | Positive² | <i>M. tuberculosis</i> infection likely |
| | < 0.35 | < 0.5 | Indeterminate³ | Results are indeterminate for TB-Antigen responsiveness |
| | ≥ 0.35 and < 25% of Nil value | < 0.5 | | |
| > 8.0 ⁴ | Any | Any | | |

From: QuantiFERON®-TB Gold IT product insert

T-spot[®].TB: ELISPOT

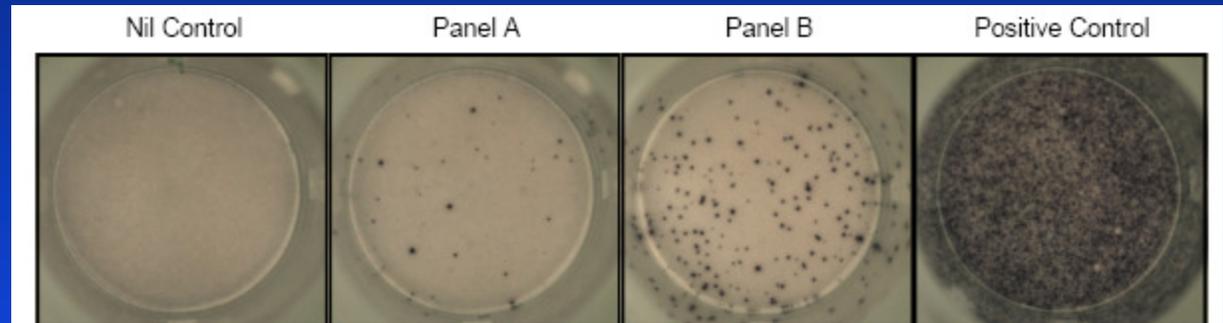

**CPT
tubes**

**Transport <
8 hr at room
temperature**

ELISPOT assay

- Adults and children 10 years old and over: one 8mL or two 4mL tubes
- Children 2-9 years old: one 4mL tube
- Children up to 2 years old: 2mL paediatric tube

From: T-spot[®].TB Visual procedure guide

T-spot[®].TB: ELISPOT

Interpretation of test result

- The test result is Positive if (Panel A-Nil) and/or (Panel B-Nil) ≥ 8 spots.
- The test result is Negative if both (Panel A-Nil) and (Panel B-Nil) ≤ 4 spots.
- The test result is Borderline if the highest of the Panel A or Panel B spot count (minus Nil) is 5, 6 or 7.
- The test result is Invalid if:
 - Nil > 10 spots.
 - Mitogen < 20 spots AND both (Panel A-Nil) and (Panel B-Nil) ≤ 4 spots.

From: Summarized from T-spot[®].TB Product insert

Use of IGRA's in adults

- CDC Recommendations: “QFT-G can be used in all circumstances in which the TST is used, including contact investigations, evaluation of recent immigrants who have had BCG vaccination, and TB screening of health-care workers and others undergoing serial investigation for *Mycobacterium tuberculosis* infection. QFT-G usually can be used in place of (and not in addition to the TST)” (MMWR, Dec. 16, 2005, Vol.54.)
- FDA Approvals:
 - QFT TB (11/28/01); QFT TB Gold (12/2/04); QFT TB Gold-IT (10/10/07)
 - T-SPOT.TB (7/25/08)

Evidence-based evaluation of IGRA's vs TST

Evaluation without reference to a gold standard diagnostic for LTBI:

- Sensitivity in culture positive TB.
- Relationship with exposure risk factors.
- Specificity in low risk populations.
- Prospective prognostic studies.

Evaluation vs TST in children: Promise of IGRA's

Evaluation without reference to a gold standard diagnostic for LTBI:

- **Sensitivity in culture positive TB.**
- Relationship with exposure risk factors.
- Specificity in low risk populations.
- Prospective prognostic studies.

QFT-Gold for Diagnosis of LTBI in active TB

| QFT version | Study, year, country | Age range | Young/total | Sensitivity of TST in active TB n/N (%) | Sensitivity of IGRA in active TB n/N (%) |

Diagnosis of LTBI/household contacts: QFT

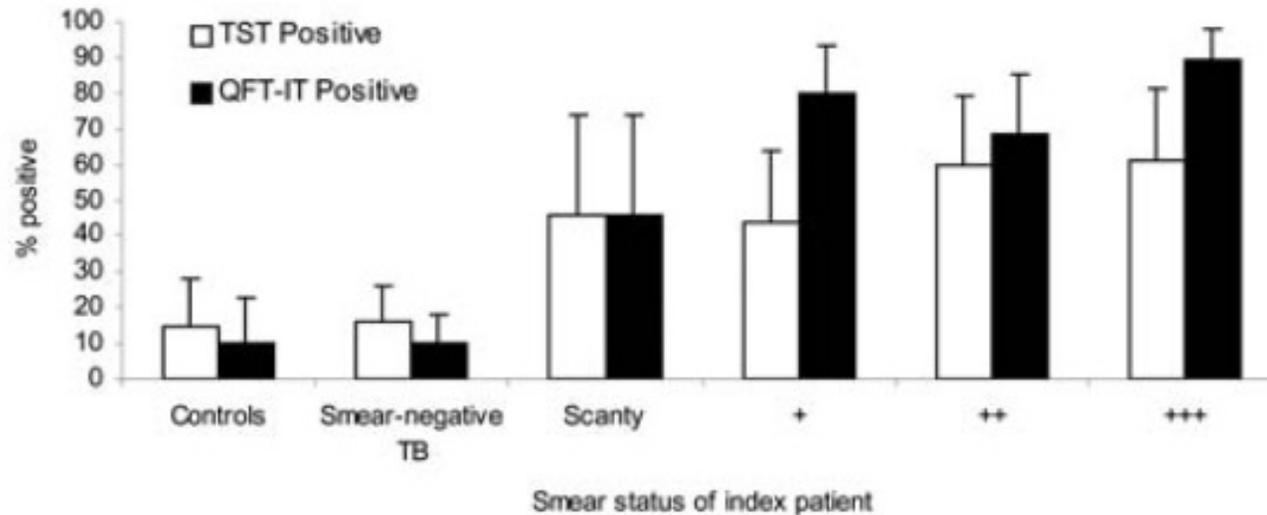

Figure 2. Proportion of children with positive tuberculin skin test (TST) (>10 mm) and QuantiFERON Gold in Tube (QFT-IT) test results, by adult smear positivity. Error bars show 95% confidence intervals.

T-spot[®].TB for LTBI diagnosis

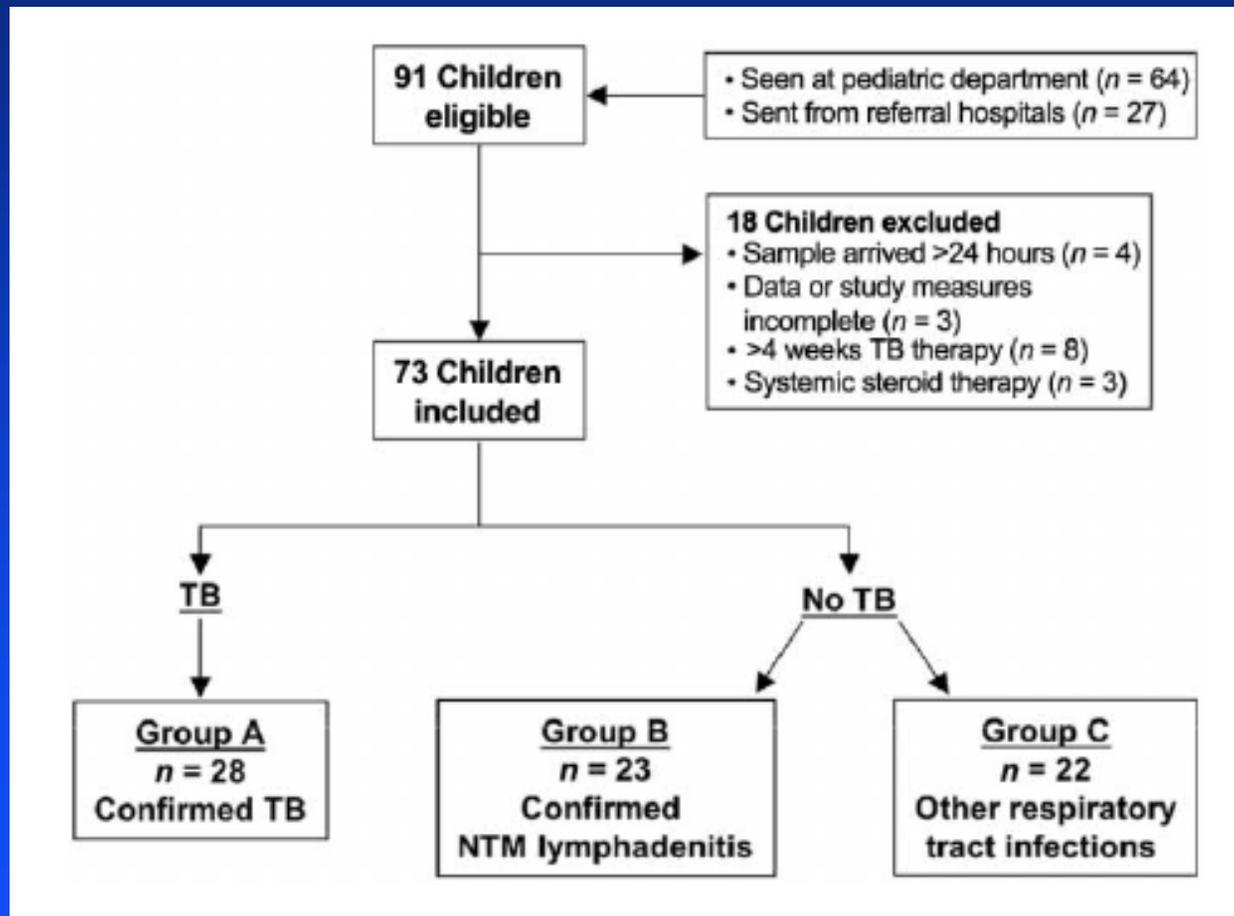

| Study, year, country | Age range | Young/total | TST positivity rate n/N (%) | Concordance TST/QFT |
|---|-------------|--------------------|-----------------------------|--------------------------------|
| Connell, 2008, Australia | 1 - 19 | NR/100 | 47/97 (48) | 75% K = .51 |
| Dominguez, 2007, Spain | 0 - 18 | 15/134 (11%) | 115/134 (86) | BCG-:25/40 (62), K=.33 |
| Hesseling, 2008, South Africa  | 0-5 | 29/29 | 15/28 (54) | NR (46), K=-0.15 TST-/IGRA+ |
| Kampmann, 2009, UK | 0-16 | 56/118; < 5 yrs | 57/114 (50) | NR (75); K = .49 |
| Mandalakas, 2008, S. Africa | NR, X = 4.4 | All HIV+; NR/23 | 6/23 (26) | NR (67) K = .33; TST-/IGRA+ |

Evaluation vs TST in children: Promise of IGRA's

Evaluation without reference to a gold standard diagnostic for LTBI:

- Sensitivity in culture positive TB.
- Relationship with exposure risk factors.
- **Specificity in low risk populations.**
- Prospective prognostic studies.

Specificity of Diagnosis of LTBI in TB suspects: QFT-IT/ T-spot[®].TB vs TST

QFT-TB Gold-IT vs T-spot, Germany
PPD Chiron (10 TU), positive ≥ 5 mm

Detjen, et al., CID, 2007.

Specificity of Diagnosis of LTBI in TB suspects: QFT-IT/ T-spot[®].TB vs TST

Table 3. Indicators of diagnostic accuracy for the tuberculin skin test (TST), QFT-IT, T-SPOT, and the combination of QFT-IT and T-SPOT.

| Test | Sensitivity, % (95% CI) | Specificity, % (95% CI) | Positive LR (95% CI) | Negative LR (95% CI) | Positive PV, % (95% CI) | Negative PV, % (95% CI) |
|----------------------------------|----------------------------|----------------------------|-------------------------------|-----------------------------|----------------------------|----------------------------|
| TST | 100 (88–100) | 58 (42–73) | 2.4 (1.6–3.4) | 0.1 ^a (0.01–0.4) | 62 (47–76) | 100 (85–100) |
| QFTIT | 93 (77–99) | 100 (91–100) | 37.1 ^b (5.3–258.0) | 0.1 (0.02–0.3) | 100 (87–100) | 95 (84–99) |
| T-SPOT | 93 (77–99) | 98 (87–100) | 37.1 (5.3–258.0) | 0.1 (0.02–0.3) | 96 (81–100) | 95 (83–99) |
| QFTIT and T-SPOT (both positive) | 89 (72–98) | 100 (91–100) | 35.7 ^b (5.1–248.4) | 0.1 (0.04–0.3) | 100 (86–100) | 93 (81–99) |
| QFTIT and T-SPOT (1 positive) | 96 (82–100) | 98 (87–100) | 38.6 (5.6–267.5) | 0.04 (0.01–0.3) | 96 (82–100) | 98 (87–100) |
| Stepwise approach ^c | 93 (77–99) | 100 (91–100) | 37.1 ^b (5.3–258.0) | 0.1 (0.02–0.3) | 100 (87–100) | 95 (84–99) |

NOTE. Calculations were based on 68 children, including 28 children with confirmed tuberculosis (group A) and 40 unvaccinated children without tuberculosis (19 children with confirmed nontuberculous mycobacterial lymphadenitis [group B] and 21 children with other respiratory tract infections [group C]). LR, likelihood ratio; PV, predictive value; QFT-IT, QuantiFERON-TB Gold In-Tube (Cellestis); T-SPOT, T SPOT-TB (Oxford Immunotec).

^a For calculation of this LR, we classified 1 correct diagnosis in a child with tuberculosis as a false-negative result (to avoid division by 0).

^b For calculation of this LR, we classified 1 correct diagnosis in a child without tuberculosis as a false-positive result (to avoid division by 0).

^c We also calculated diagnostic accuracy in a stepwise approach according to recent National Institute of Health and Clinical Excellence guidelines [15]; only patients with positive TST results were tested with IFN- γ release assays. QFTIT and T-SPOT showed the same values for all indicators.

Specificity of IGRA in BCG-vaccinated children

- Inclusion: No risk and TST ≥ 5 mm.
- 62 children age 2 months – 14 years, all BCG vaccinated.
- 0/62 QFT-IT positive

Evaluation vs TST in children: Promise of IGRA's

Evaluation without reference to a gold standard diagnostic for LTBI:

- Sensitivity in culture positive TB.
- Relationship with exposure risk factors.
- Specificity in low risk populations.
- **Prospective prognostic studies.**

Diagnosis of LTBI/school contacts: QFT

- 349 15-16 y/o boys, all BCG vaccinated.
- Tested with TST: 95 of 349 positive.
- 88 TST positive tested with QFT-TB Gold: 4 of 88 positive.
- 3 of 4 in high exposure group – received INH.
- Remaining TST positive students – no INH and no disease with 3+ years follow-up.

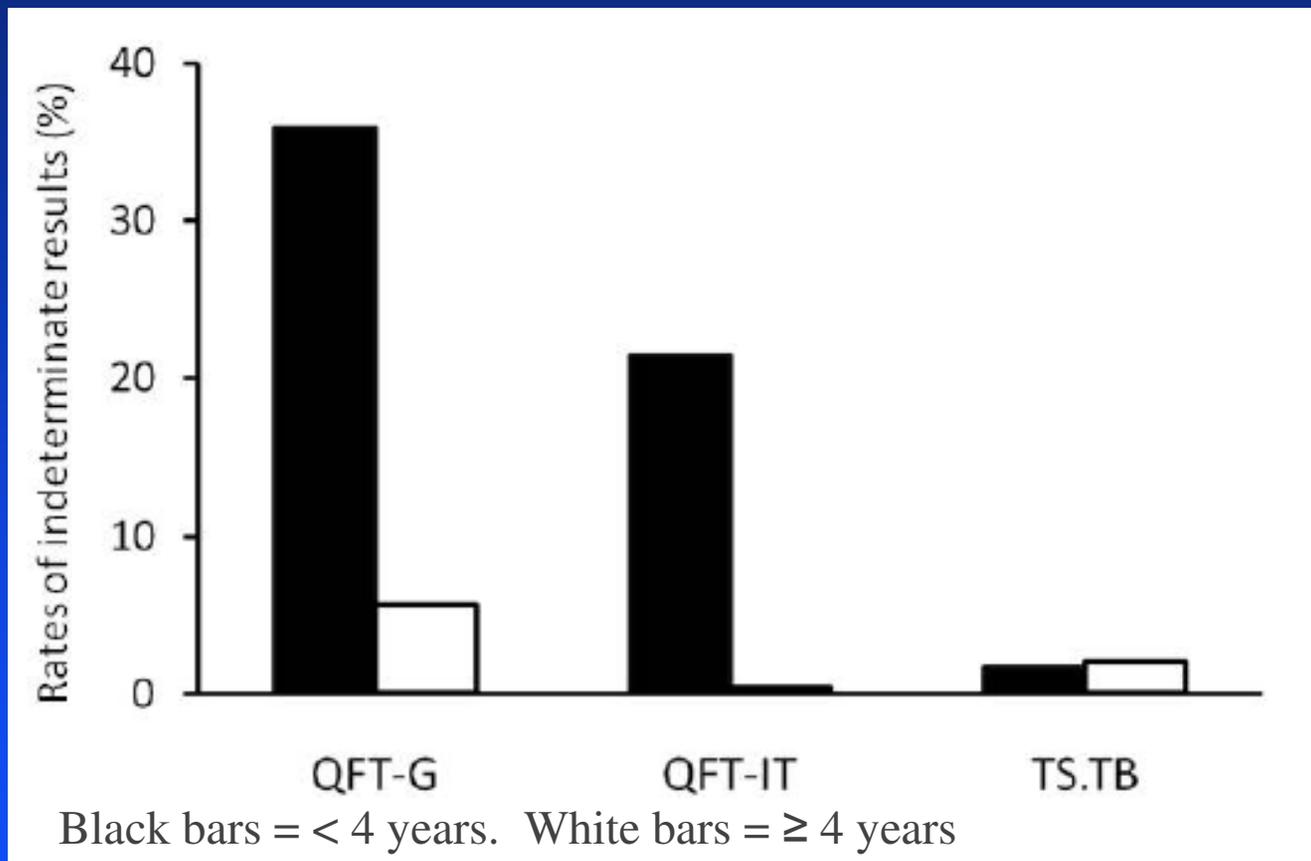

Limitations of IGRA's in Children

- Paucity of data in children < 5 years.
- Increased frequency of indeterminate assays in children < 5 years.
- Required blood volumes.
- Lack of longitudinal data.

Limitations of IGRA's in young children

| QFT version | Study, year, country | Age range | Young/total | Indeterminate n/N (%) | QNS Blood n/N (%) |
|-------------|------------------------------|-------------|--------------------------------|--------------------------|----------------------|
| QFT Gold | Connell, 2006, Australia | 0 - 18 | NR/101 | 17/101 (17) | 3/101 (3) |
| QFT Gold | Hesseling, 2008, S. Africa | 0 - 5 | 29/29 | 3/21 (14) | 7/29 (24) |
| QFT Gold | Mandalakas, 2008, S. Africa | NR, X = 4.4 | All HIV+; NR/23 | 0/12 (0) | 11/23 (47) |
| QFT Gold | Okada, 2007, Cambodia | 0 - 5 | 210/210 : < 6 yrs | 9/208 (6) | 13/217 (6) |
| QFT Gold IT | Bruzzese, 2009, Italy | 2 - 24 | NR; all HIV neg, immunocomp | 16/80 (20) | NR |
| QFT Gold IT | Chun, 2008, Korea | 0-13 | NR: Med = 1.7 yr | 17/227 (7.5) | NR |
| QFT Gold IT | Connell, 2008, Australia | 1 - 19 | NR/100 | 0/38 (0) | 5/101 (5) |
| QFT Gold IT | Lighter, 2008, USA | 0 - 18 | 67/207, < 5 yrs | 3/207 (1) | 0/207 (0) |
| QFT Gold IT | Nakaoka, 2006, Nigeria | 0 - 14 | NR/207 | 33/207 (16) | NR |
| QFT Gold IT | Dogra, 2007, India | 1 - 12 | 42/105 , < 5 yrs | 0/105 (0) | 0/105 (0) |
| QFT Gold IT | Dominguez, 2007, Spain | 0 - 18 | 15/134 (11%) | 3/134 (2) | NR |
| QFT Gold IT | Kampmann, 2009, UK | 0-16 | 56/118; < 5 yrs | 14/209 (7) | 0/209 (0) |
| QFT Gold IT | Tsiouris, 2006, South Africa | 5-15 | NA/NR | NR | 37/221 (17) |

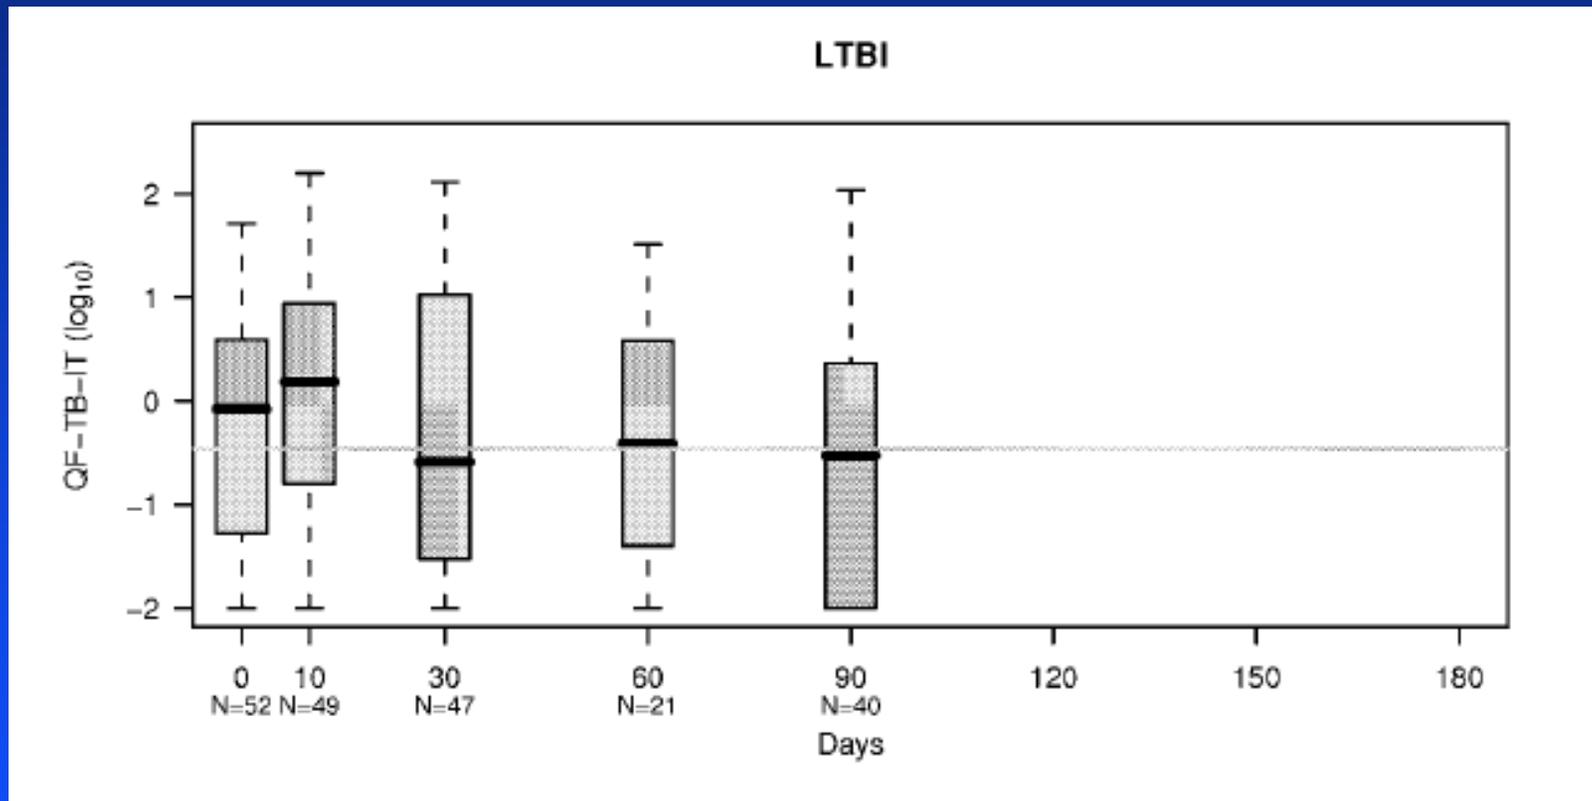

Indeterminate rates of IGRA's

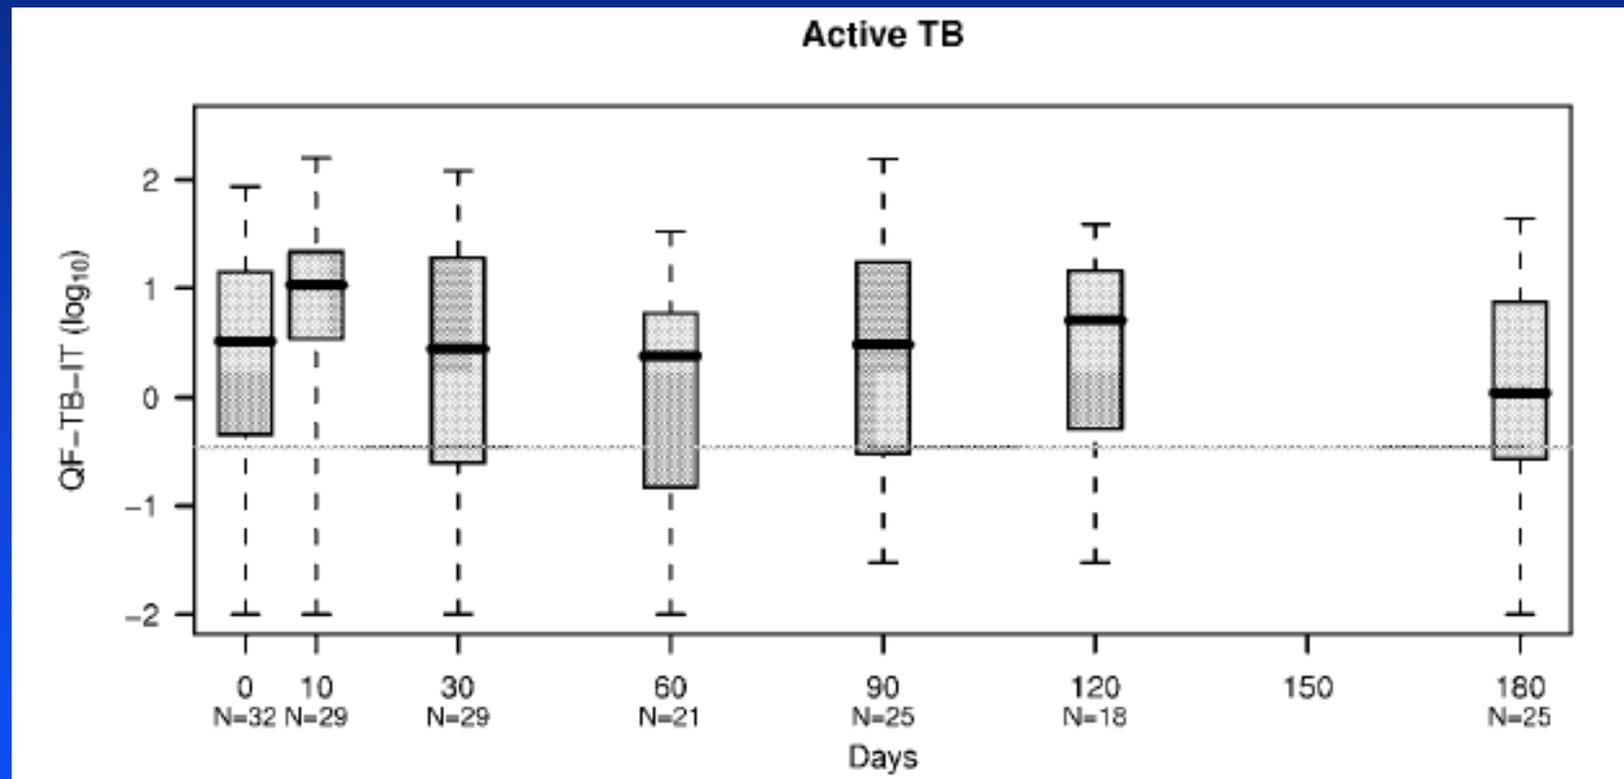

QFT-TB Gold vs QFT-IT vs T-spot,
Italy

Bergamini, et al., Pediatrics, 2009.

Longitudinal IGRA data in children

Longitudinal IGRA data in children

QFT vs T-SPOT.*TB*

Specificity: QFT

- BCG-vaccinees

Sensitivity: T-SPOT.*TB*

- Immunocompromised
- Young children

What would we like in a test?

Specificity and Sensitivity: The DiCaprinator

With permission: Photoshop by David Lewinsohn

QFT vs T-SPOT.TB in children

- QFT more available than T-SPOT.TB
- More published data in children for QFT than for T-SPOT.TB.
- Less indeterminate results for T-SPOT.TB compared to QFT.
- Less blood required for T-SPOT.TB than for QFT.
- Specificity equivalent in one study.
- Sensitivity of T-SPOT.TB increased, equal, decreased when compared with QFT-IT.
- Increase positive tests with T-SPOT.TB

Indications for IGRA's and TST in children (My opinion)

- Close contacts of active TB cases:
- Immigrants from endemic countries:
- Significant travel history:
 - IGRA preferred to TST in children ≥ 5 years.
 - TST preferred to IGRA in children < 5 years.

Indications for IGRA's and TST in children (My opinion - continued)

- TB suspects:
- HIV infection:
- Increased risk of progression of LTBI:
 - Consider both IGRA and TST and take either positive as evidence of infection.

Upcoming recommendations

- ATS/CDC/IDSA (AAP) guidelines:
- CDC guidelines – updated for QFT-Gold-IT and T-SPOT.*TB*.
- AAP – 2009 RedBook

Future research needs for IGRA's in children

- High risk young children in low incidence setting (Household contact study in young children).
- Longitudinal data in young children (Data to inform “window prophylaxis”).
- Young immunosuppressed and HIV-infected children.

New assays for TB diagnosis in children

- IP-10 assays (ELISA/CD4)
- IFN- γ , IL-2, TNF- α (Flow cytometry)
- CD8+ T cells (ELISPOT)
- Antibodies in lymphocyte supernatant (ALS)
