

# Updated WHO MDR-TB treatment guidelines and the use of new drugs in children

**Annual meeting of the  
Childhood TB subgroup**  
Liverpool, UK, 26 October 2016

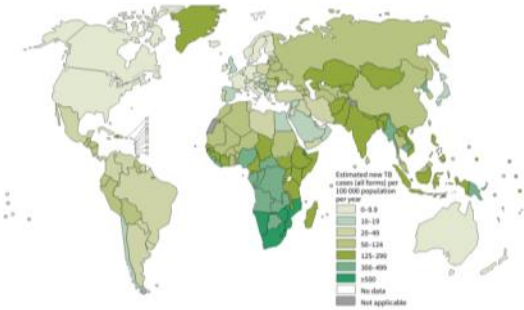

**Dr Malgosia Grzemska**  
**WHO/HQ, Global TB Programme**

# Outline

---

- Latest epidemiological data
- Existing guidelines
- 2016 update of the DR-TB treatment guidelines
- New recommendations for treatment of RR-TB and MDR-TB in children
- Delamanid guideline for use in children and adolescents
- Research gaps
- Conclusions

# The Global Burden of TB - 2015

## Estimated number of cases

## Estimated number of deaths

All forms of TB

10,4 million

• 1 million Children (10%)

1.8 million\*

• **210,000 children**  
(170,000 HIV negative and 40,000 HIV-positive)

HIV-associated TB

1.2 million (11%)

390,000

Multidrug-resistant TB

480,000

190,000

+100,000 RR cases

# Childhood TB: MDRTB estimates

Dodd P., Sismanidis B., Seddon J., Lancet Inf Dis, 21 June 2016:

## Global burden of drug-resistant tuberculosis in children: a mathematical modelling study

- It is estimated that over 67 million children are infected with TB and therefore at risk of developing disease in the future;
  - 5 mln with INH resistance; 2 mln with MDR; 100,000 with XDR
- **Every year 25,000 children develop MDRTB and 1200 XDR TB**

# MDR-TB in children

---

- MDR-TB in children is mainly the result of transmission of a strain of *M. tuberculosis* that is **MDR from an adult source case**, and therefore often not suspected unless a history of contact with an adult pulmonary MDR-TB case is known.
- Referral to a specialist is advised for treatment.

# WHO Guidance on the management of TB in children - 2<sup>nd</sup> edition 2014: treatment

## Annex 3 – Management of drug-resistant TB in children

- Do not add a drug to a failing regimen.
- Treat the child **according to the drug susceptibility pattern (and using the treatment history) of the source case's** *M. tuberculosis* strain if an isolate from the child is not available.
- Use at least four drugs certain to be effective.
- Use **daily treatment only**; directly observed therapy is essential.

# WHO Guidance on the management of TB in children - 2<sup>nd</sup> edition 2014: treatment

- **Counsel the child's caregiver** at every visit, to provide support, advice about adverse events and the importance of compliance and completion of treatment.
- **Follow-up** is essential: clinical, radiological and bacteriological (mycobacterial culture for any child who had bacteriologically confirmed disease at diagnosis).
- With correct dosing, **few long-term adverse events** are seen with any of the more toxic second line drugs in children.

# 2016 WHO guidelines on the management of drug resistant TB

# WHO guidelines for the treatment of drug-resistant tuberculosis. 2016 update

## *Key changes*

- A shorter MDR-TB treatment regimen is recommended for RR-/MDR-TB patients (under several conditions)
- The design of conventional MDR-TB regimens uses a different regrouping of second-line medicines
- **Recommended treatment of children with RR-/MDR-TB** based on a first-ever meta-analysis of individual-level paediatric patient data for treatment outcomes
- Recommendation on partial lung resection surgery

# Shorter MDR-TB regimen (1)

In patients (adults and children) with

- rifampicin-resistant TB or MDR-TB,
- who have not been previously treated with second-line drugs and
- in whom resistance to fluoroquinolones and second-line injectable agents has been excluded or is considered highly unlikely

a shorter MDR-TB regimen of **9–12 months** may be used instead of a conventional regimen

- Conditional recommendation – very low quality of evidence

# Shorter MDR-TB regimen (2)

## *Main remarks*

- Standardized regimen; limited modifications are possible
- 4-6 Km-Mfx-Pto-Cfz-Z-H<sub>high-dose</sub>-E / 5 Mfx-Cfz-Z-E
- Recommendation applies to adults, **children**, PLHIV
- Ideally, patients are tested for resistance to fluoroquinolones and second-line injectable drugs; not recommended in case of 2<sup>nd</sup> line drug resistance, extrapulmonary disease and pregnancy

# Shorter MDR-TB regimen (2)

## *Main remarks*

- Lowered costs (<US\$1,000 in drug costs/patient)
- Monitoring for effectiveness, relapse, and harms (active TB drug safety monitoring and management (aDSM)) applies
- Trials expected to provide high-certainty evidence

<p><b>GROUP A</b></p> <p>Fluoroquinolones</p>	<p>Levofloxacin Moxifloxacin Gatifloxacin</p>						
<p><b>GROUP B</b></p> <p>Second-line injectable agents</p>	<p>Amikacin Capreomycin Kanamycin (Streptomycin)</p>						
<p><b>GROUP C</b></p> <p>Other Core Second-line Agents</p>	<p>Ethionamide / Prothionamide Cycloserine / Terizidone Linezolid Clofazimine</p>						
<p><b>GROUP D</b></p> <p>Add-on agents</p> <p><i>(not core MDR-TB regimen components)</i></p>	<table border="1"> <tr> <td data-bbox="1062 706 1188 878"><b>D1</b></td> <td data-bbox="1188 706 1883 878"> <p>Pyrazinamide Ethambutol High-dose isoniazid</p> </td> </tr> <tr> <td data-bbox="1062 878 1188 992"><b>D2</b></td> <td data-bbox="1188 878 1883 992"> <p>Bedaquiline Delamanid</p> </td> </tr> <tr> <td data-bbox="1062 992 1188 1278"><b>D3</b></td> <td data-bbox="1188 992 1883 1278"> <p><i>p-aminosalicylic acid</i> Imipenem-Cilastatin Meropenem Amoxicillin-Clavulanate (Thioacetazone)</p> </td> </tr> </table>	<b>D1</b>	<p>Pyrazinamide Ethambutol High-dose isoniazid</p>	<b>D2</b>	<p>Bedaquiline Delamanid</p>	<b>D3</b>	<p><i>p-aminosalicylic acid</i> Imipenem-Cilastatin Meropenem Amoxicillin-Clavulanate (Thioacetazone)</p>
<b>D1</b>	<p>Pyrazinamide Ethambutol High-dose isoniazid</p>						
<b>D2</b>	<p>Bedaquiline Delamanid</p>						
<b>D3</b>	<p><i>p-aminosalicylic acid</i> Imipenem-Cilastatin Meropenem Amoxicillin-Clavulanate (Thioacetazone)</p>						

# Recommendation on longer MDR-TB regimen (1)

In patients with rifampicin-resistant TB or MDR-TB, *a regimen with at least five effective TB medicines* during the intensive phase is recommended, *including pyrazinamide and four core second-line TB medicines – one chosen from Group A, one from Group B, and at least two from Group C*

**Group A =**

levofloxacin;  
moxifloxacin;  
gatifloxacin

**Group B =**

amikacin,  
capreomycin,  
kanamycin,  
(streptomycin)

**Group C =**

ethionamide/  
prothionamide,  
cycloserine/  
terizidone, linezolid,  
clofazimine

# Recommendation on longer MDR-TB regimen (1)

- If the minimum number of five effective TB medicines cannot be composed as given above, an *agent from Group D2 and other agents from Group D3 may be added to bring the total to five*
- the regimen may be further strengthened with high-dose isoniazid and/or ethambutol

## Group D2

bedaquiline,  
delamanid

## Group D3

p-aminosalicylic  
acid, imipenem–  
cilastatin,  
meropenem,  
amoxicillin–  
clavulanate,  
(thioacetazone)

# Choosing the treatment regimen for RR-/MDR-TB

- Confirmed resistance or suspected ineffectiveness to a medicine in the shorter MDR-TB regimen (except isoniazid resistance)?
- Exposure to  $\geq 1$  second-line medicines in the shorter MDR-TB regimen for  $>1$  month?
- Intolerance to  $\geq 1$  medicines in the shorter MDR-TB regimen or risk of toxicity (e.g. drug-drug interactions)?
- Pregnancy?
- Extrapulmonary disease?
- At least one medicine in the shorter MDR-TB regimen not available?

**NO**

**Shorter MDR-TB regimen**

**FAILING REGIMEN, DRUG INTOLERANCE, RETURN AFTER INTERRUPTION  $>2$  MONTHS, EMERGENCE OF ANY EXCLUSION CRITERION**

**YES**

**Longer MDR-TB regimens**

# Delamanid

---

- Children (6 – 11 years) - 50 mg – 2x /day for 6 months and
- Adolescents (12-17 years) – 100mg 2x /day for 6 months in adolescents aged 12 to 17
  - may be added to a WHO recommended longer MDR-TB treatment regimen
- *(conditional recommendation, very low confidence in estimates of effects)*

# Delamanid (2)

---

- Patients with additional resistance or intolerance to fluoroquinolones or second line injectable drugs
- Patients with extended lesions, advanced disease and others deemed at higher baseline risk for poor outcomes
- Patients with XDR-TB

# Delamanid (3)

---

- Excludes paediatric cases with reported QTc prolongation (greater than 500msec);
- Paediatric patients with HIV co-infection were excluded from the analysed studies; drug has not been tested in patients with extra-pulmonary MDR-TB
- Studies are underway, currently there are no data on the effect of delamanid in children younger than 6 years of age and weighting under 20 kg.

# Bedaquiline

---

- No data available on the use of BDQ in children (patients younger than 18 years),
- Janssen BDQ compassionate use programme excluded paediatric patients

# Research gaps

- Need for more randomised control studies, especially involving new drugs and regimens (adults and children)
- Inclusion of children and separate reporting of outcomes
- Identification of factors which determine the optimal duration of treatment for children
- PK studies to determine optimal drug dosing and safety
- Improved diagnostics and DST methods for children
- **Studies on preventive chemotherapy for children in contact with MDR-TB**

# Conclusions

---

- MDR-TB in children recognized and guidelines available
- Finally evidence based recommendations for treatment of RR-TB and MDR-TB in children

BUT

- **Need for more data, especially on the use of new drugs and new regimens**

AND

- **Evidence needed to promote preventive chemotherapy for children in contact with a confirmed MDR TB in the household**
